

The distribution box was not grounded as required

Correct grounding of services depends upon understanding the definition and role of the grounded conductor. The neutral conductor is typically the grounded conductor connected to the system's ...

Systems operating below 50V aren't required to be grounded or bonded per 250.30 unless the transformer's primary supply is from a 277V or 480V system or an ungrounded system [250.20 (A)].

The bottom line is that bucket trucks may or may not be required to be grounded according to employer rules. If the bucket truck is positioned so that no part of the knuckle of the ...

This section applies to grounding of transmission and distribution lines and equipment for the purpose of protecting employees. Paragraph (d) of this section also applies to protective grounding of other ...

Each DISTRIBUTION BOX and controller must be grounded. On the US market, a 5.26 mm² (10 AWG) ground wire must be used, and in all other markets a 6 mm² must be used.

If you've ever found yourself scratching your head over whether that metal door on your distribution cabinet really needs a grounding wire, you're not alone. In factories, construction sites, ...

There is no other visible means of grounding at the sub panel located in the basement, or anywhere else in the house. Yet every outlet is reading grounded correctly.

According to NEC Article 250, neutral and ground wires must remain separate in subpanels. Bonding (connecting) the neutral and ground should only occur in the main panel or at the first service ...

A proposal was accepted at the first draft meeting but reversed at the second draft meeting that would have required all equipment grounding conductors within a box to be spliced together even if they ...

The distribution box was not grounded as required
